

Title:

Data Labeling Project – Image & Text Annotation

About the Project:

This project demonstrates practical experience in data labeling for machine learning applications, including image annotation and text classification.

The objective was to create structured, high-quality labelled datasets that can be used for training AI models in computer vision and natural language processing tasks.

Project Scope:

- Image Annotation (Object Detection)
- Text Classification (Sentiment Analysis)
- Dataset Structuring and Quality Control

Tools Used:

- Manual Annotation Techniques
- Spreadsheet Tools (Excel / Google Sheets)
- Basic Annotation Tools (LabelImg concept, CVAT)

Dataset Details:

Image Dataset:

- Total Images: 100+
- Categories: Person, Car, Mobile, Background Objects

Text Dataset:

- Total Entries: 200+
- Labels: Positive, Negative, Neutral

Methodology:

1. Data Collection:

- Selected publicly available sample images and text data

2. Annotation Process:

- Assigned labels based on defined categories
- Maintained consistency in labeling rules

3. Quality Check:

- Reviewed samples manually
- Ensured accuracy and correct classification

4. Dataset Structuring:

- Organized labeled data into structured format

Sample Output:

Image Annotation:

- Image1.jpg → Person, Car
- Image2.jpg → Mobile

Text Classification:

- “This product is amazing” → Positive
- “Very bad experience” → Negative
- “It is okay” → Neutral

Accuracy (Self-reviewed):

Estimated Accuracy: 90–95%

Based on manual validation and consistency checks

Outcome:

Successfully created structured datasets suitable for training AI models in:

- Object Detection
- Sentiment Analysis

Conclusion:

This project demonstrates the ability to perform accurate and consistent data labeling, which is a critical step in building reliable AI systems.
